Breakthrough Technology in Teeth Whitening

NATURAL⁺™

The natural solution for teeth whitening

While the process of decomposition of H_2O_2 depends on :

- **Temperature**
- **Impurities**
- **Stabilizers**

And also :

- **Metals of transition**
- **Catalyst**

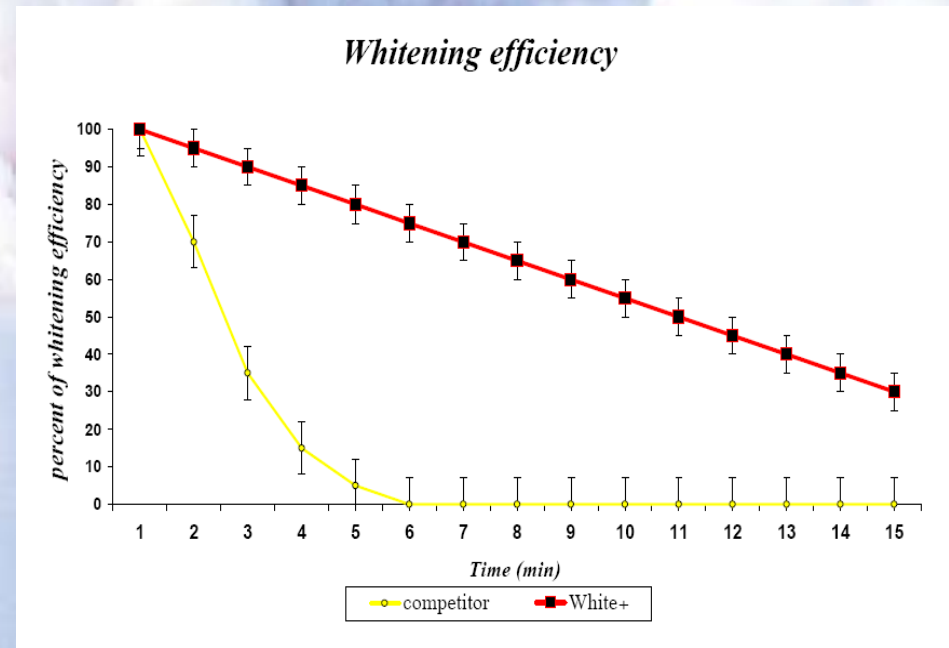

The Natural+™ patented, ecological active agent has a literally different operating mode.

meodental

Since the Natural+™ active agent is stabilized, its process of releasing oxygen is *progressive* and not volatile and its **whitening power is increased.**

This specific property allows the formula to keep its efficiency over a period of more than 30 min. thus ***avoiding the need to renew the application of the gel between two sessions of treatment.***

NATURAL+™

The natural solution for teeth whitening

meodental

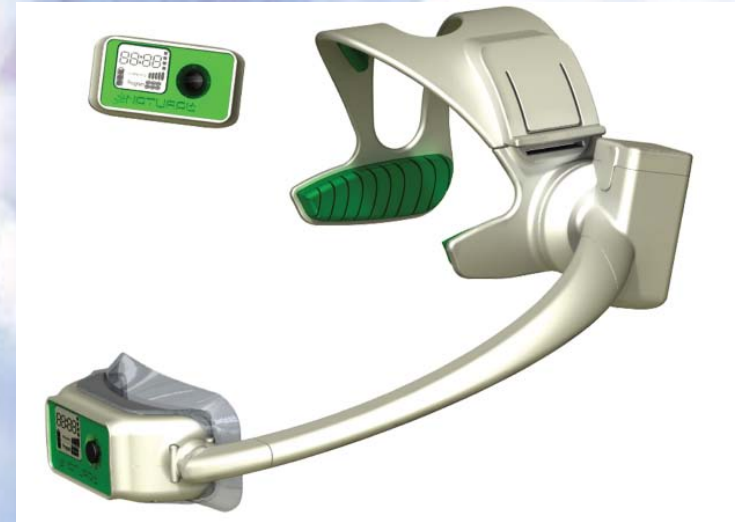

The light of the **Natural+™** LED Lamp, without giving off heat or UV radiation, controls the whitening properties of the **Natural+™** Gel.

The **Natural+™** LED Lamp is a revolutionary LED (Light Emitting Diode) system and is the only one on the market that has several scientifically developed programs designed to accelerate and optimize the results of the **Natural+™** Gel as well as any other dental whitening product.

The blue LEDs act as a catalyst to the whitening gel and improve the efficiency of whitening superficial and in-depth tooth discolorations.

The red LEDs assist in reducing sensitivity when working with the **Natural+™** Gel unique formula.

Thanks to the stability of the formula, the dentist can control the pace of decomposition via the intensity and duty cycle of illumination by selecting the appropriate **Natural+™** LED Lamp program.

 **NATURAL+™**
The natural solution for teeth whitening

meodental

**The Natural+™ Gel includes
Calcium in the formula:**

- To prevent demineralization
- To act as a buffer on the
acidity
- To allow the whitening gel
to
preserve a neutral pH

NATURAL+™

The natural solution for teeth whitening

meodental

Since with Natural+™ you reach a greater whitening power, it **significantly reduces the treatment time at the dentist's chair.**

A single session of 30 min. is enough to gain up to 8 shades.

 **NATURAL+™**

Meodental's Natural+™ is a unique process which answers even the most difficult clinical cases as the treatment of *dyschromies of intrinsic type (tetracycline / fluorosis) and extrinsic type.*

The Natural+™ formula maintains an optimal degree of hydration of the tooth all through a dental bleaching procedure, thus avoiding the exchanges of oral flows.

Natural+™ Product Range

Natural+™ Home Kit is a self administering kit that patients can obtain from the dental clinic after consultation.

It ensures optimal results from the comfort of the patient's home as a standalone treatment or, for more severe cases, in combination with the Natural+™ Professional application.

It also contains our exclusive Natural+™ Gel which is safe, reliable, and far more efficient than any other home treatment or over the counter product, without the side effects or sensitivities.

Meodental's unique constant-dose application syringe delivers the correct amount of gel per tooth thus ensuring patient safety , comfort and ease of use.

Differences

- First and foremost the HYDROGEN **PEROXIDE** **used in our gel is totally different, mainly because it is stabilized (patented).**
- If regular HYDROGEN PEROXIDE dissolves in an open bottle at room temperature within 3-5 minutes **ours is stable for up to 3 YEARS.**
- In addition thanks to the different manufacturing process of our gel it does **not include any residues of heavy metals.**
- These residues, present in all other products, connect to minerals on the tooth surface and cause diffusion of water from the tooth and, thus, dehydration.
- Another advantage of our stabilized formula is in our ability to add a high concentration of minerals without dissolving the HYDROGEN PEROXIDE.
- **Our formula, , unlike others maintains a neutral PH not only in the syringe but also on the tooth while activated and throughout the treatment.**

Advantages (1/3)

- **Virtually no sensitivity –**
 - **The gradual linear (rather than fast exponential) release of the radical oxygen ions.**
 - **Neutral PH** throughout the treatment.
 - **No tooth dehydration**
 - **High concentration of minerals with desensitizing effect as calcium and potassium nitrate.**

Advantages (2/3)

- **Simpler procedure –**
 - **Only one application is required for the entire in-office treatment of 30-45 minutes with gel and lamp.**
 - **Entire procedure (chair-time) duration of less than one hour (about half of any other product).**
 - **In all regular cases no second session or home continuation is required.**
 - **Both arches are treated simultaneously without the risk of sensitivity.**
 - **Severe cases, previously considered untreatable, (e.g. tetracycline stains) are treated with the exactly same simple procedure only with either home continuation or a second session.**

Advantages (3/3)

- **Higher efficiency –**
 - **Continuous slow release of the radical oxygen ions enables a larger portion of them to penetrate the tooth through the enamel.**
 - **Tooth is not dehydrated (rather is constantly irrigated)** so the oxygen ions, carried by water, penetrate deeper into the dentine.
- **Long-lasting results –**
 - **No regression due to tooth re-hydration** (there is no dehydration to begin with). Teeth maintain transparent and vivid look after the treatment.
 - **Slow release of oxygen ions continues up to 24 hours after treatment ends resulting in further improvement.**
